 @NexJob

Made for:

# NexJob

We selected youth employment as our main focus and by searching the open source data provided, we found a combination of sources that can be very helpful for students between the ages of 15 and 24.

# NexJob

The students first select the field they're studying in, and using our algorithm we would provide a list of jobs sorted by the highest potential of growth.

We highlight the jobs that are directly related to the student's field as well as providing jobs in the same industry for further discovery.

# NexJob

On top of that, we also show which provinces are best to work in for that industry based on the total number of employees, and average salary.

# NexJob

## Future plans

We would improve the accuracy of the best province for the industry by improving the algorithm (e.g. we would use the ratio of salary to cost of living instead of only salary).

# NexJob

## Future plans

We would give a better understanding of the gender gap in each industry by providing individual average hourly rates for male and female employees as well as each gender's total number of employees in the industry.
